

PAPER FILTER

For very fine filtration of vegetable oil a paper filter is a solution used for lower oil flow rates.

The filter is made of special paper, through which the oil is filtered. A roll of filter paper is mounted at the side of the construction and covers the full length of the filter. The dirty paper is collected at the out feed end.

When the paper has reached a certain degree of pollution, it automatically transfers clean paper to the filtering area. The degree of pollution is set by the oil level inside the filter. An oil pump transfers the clean oil back to the main oil circulation system.

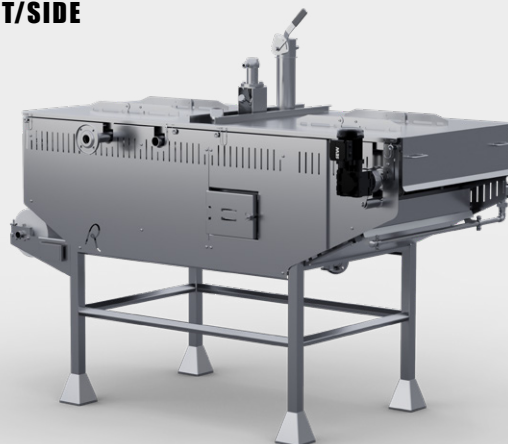

PAPER FILTER ADVANTAGES

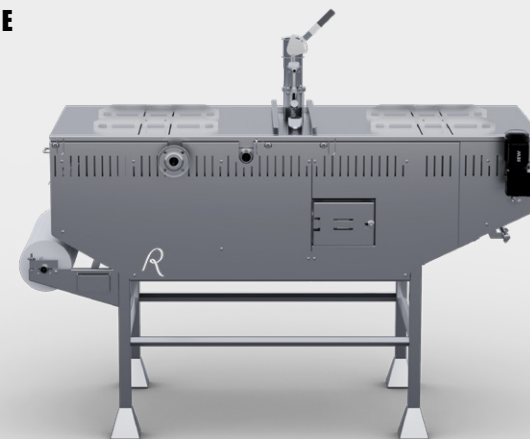

Oil level sensor for paper in-/
outfeed

Paper roll for effective feeding
